

SaaS Checkout Localization Checklist

- Audit current traffic to identify the top five geographic regions where your users originate.
- Enable IP-based location detection to automatically display the correct language and currency upon page load.
- Translate all checkout fields and button text using professional localization services rather than automated tools.
- Configure multi-currency pricing to show rounded, familiar numbers instead of raw exchange rate conversions.
- Integrate at least three local payment methods for each major target market, such as Pix for Brazil or iDEAL for the Netherlands.
- Implement a VAT/GST validation field for B2B transactions to allow for tax-exempt status where applicable.
- Review address form fields to ensure they dynamically change based on the country, such as removing "State" for regions that do not use them.
- Verify PCI DSS compliance for your payment stack to ensure all international data handling meets security standards.
- Set up real-time tax calculation logic that adds the correct sales tax or VAT based on the user's specific province or city.
- Customize confirmation emails and receipts so they arrive in the customer's native language and include locally required tax information.
- Test the mobile checkout experience specifically for regional payment apps to ensure the redirect flow is seamless on smartphones.
- Evaluate a Merchant of Record solution like PayPro Global to consolidate tax, compliance, and payment processing into a single point of management.

Run a final end-to-end transaction test in each target region using a local VPN to confirm the UI and payment rails function correctly.
